LX Jetface Conversions to 07 Model

Tools Needed:
PVC Cement
Shop towel (for excess PVC Cement)

Parts Needed:
6541-471, Ring: Power Pro Jetback To LX07
6541-470, Jetface: Power Pro LX07

Procedure:
1. Turn power to spa off.
2. Drain spa until all LX Jets are exposed.
3. Remove all LX jets. Turn outer jetface ring clockwise until you feel the detent, then continue for an additional 1/8 turn until you feel it release from the jetback.
4. Remove any/all residual moisture that remains in each jetback. Jetback surface must be dry.
5. Test fit one adapter ring in each jetback by inserting either tab into jetback slot A or B (Figure 1). This procedure will allow you to determine where to apply PVC cement on the jetback to hold the adapter ring in place.
6. Working your way around the hot tub, remove one adapter ring at a time and apply PVC cement onto the jetback surface in which it rests. Then, reinstall the adapter ring into the jetback and allow it to dry in place for a minimum 5 minutes. Clean up excess cement with a shop towel before moving to the next jet location.
7. The New 2007 LX Jetface can only be inserted one way. Once you have inserted the jetface into the jetback, turn jetface counter-clockwise to snap it in place. If you cannot turn the jetface, simply rotate jetface 180 degrees and try again.
8. Allow 24 hours for PVC Cement to cure before filling the spa.
